

# Limestone's Living Legacies

The almost magical beauty of the Cotswolds in spring and summer defies the term “unimproved grassland”. Growing on soil that is based on limestone, these grasslands can be brim-full of wild flowers, butterflies, bees and many more creatures. They are lost when they are “improved” for farming by reseeding and fertilising. Created long ago when humans cleared the forests, this is a fragile haven for species that could not survive without it.

Can you find the following species in this project:

Marsh Fritillary Butterfly

Rugged Oil Beetle

Chalk Carpet Moth

Juniper

Grizzled Skipper Butterfly

Rockrose Pot Beetle

Pasque Flower

Fly Orchid

Adder

Large Garden Bumblebee

Barbastelle Bat

Duke of Burgandy Butterfly

Greater Horseshoe Bat

Frog Orchid

Basil Thyme
